

# INVASIVE BREAST CASE STUDY

PATIENT 65 Year-Old Female Patient

TUMOR SIZE (cm) 8.0

MENOPAUSAL STATUS Post-Menopausal

TUMOR TYPE Lobular

ER STATUS (IHC) ER positive

PR STATUS (IHC) PR positive

HER2/NEU STATUS Negative

HISTOLOGIC GRADE 2

LYMPH NODE STATUS Negative

GENERAL HEALTH Fair

OTHER INFORMATION N/A

**NODE**  
**Negative**

# INVASIVE BREAST CASE STUDY

## CLINICAL EXPERIENCE

The Distant Recurrence Risk at 9 Years (Prognosis), in patients with N-, ER+ breast cancer treated with endocrine therapy alone, is provided by the TAILORx<sup>1</sup> trial for RS 0-25 and by the NSABP B-14<sup>2</sup> trial for RS 26-100. Risk is for individual RS results. The 95% confidence intervals for distant recurrence at 9 years are  $\pm 2\%$  or less for RS 0-22, and range from  $\pm 3\%$  to  $\pm 11\%$  as RS increases from 23-50. The TAILORx trial enrolled 10,273 patients and 5,018 patients with RS 0-25 were treated with endocrine therapy (tamoxifen or an aromatase inhibitor) alone. The NSABP B-14 trial enrolled 668 patients who were treated with tamoxifen alone.

The Absolute Benefit of Chemotherapy for all ages is provided by the TAILORx trial for RS 11-25 and by the NSABP B-20<sup>3</sup> trial for RS 0-10 and RS 26-100. Results for the reduction in distant recurrence at 9 years are for the TAILORx-defined RS groups 0-10, 11-25, and 26-100. TAILORx trial enrolled 10,273 patients and 6,711 were randomized to endocrine therapy (tamoxifen or an aromatase inhibitor) alone or endocrine therapy plus chemotherapy (including anthracyclines and/or taxanes). The NSABP B-20 clinical trial enrolled 651 patients who were randomized to treatment with tamoxifen alone or tamoxifen plus CMF/MF chemotherapy. The magnitude of the absolute benefit of chemotherapy was  $\sim 6\%$  at RS 26, and increased as the RS results increased from 26-100, with an average absolute benefit of  $\sim 24\%$  and a conservative group estimate of  $>15\%$  based on the width of the confidence intervals.

## RESULTS

### Recurrence Score<sup>®</sup>

18

#### Distant Recurrence Risk at 9 Years

With AI or TAM Alone

**5%**

95% CI (4%, 6%)

TAILORx

AI = Aromatase Inhibitor / TAM = Tamoxifen  
CI = Confidence Intervals

#### Group Average Absolute Chemotherapy (CT) Benefit\*

RS 11-25 All Ages

**<1%**

95% CI (-1%, 2%)

TAILORx

\*For estimated CT benefit for individual RS results, see page 2.

# INVASIVE BREAST CASE STUDY

## CLINICAL EXPERIENCE

Exploratory Subgroup Analysis for TAILORx and NSABP B-20 indicate that RS and age are the strongest predictors of chemotherapy benefit. The absolute reduction of distant recurrence from chemotherapy for patients >50 years and ≤50 years is shown here for RS groups: 11-15, 16-20, and 21-25 from TAILORx, and 0-10 and 26-100 from NSABP B-20.

## RESULTS

### Recurrence Score®

18

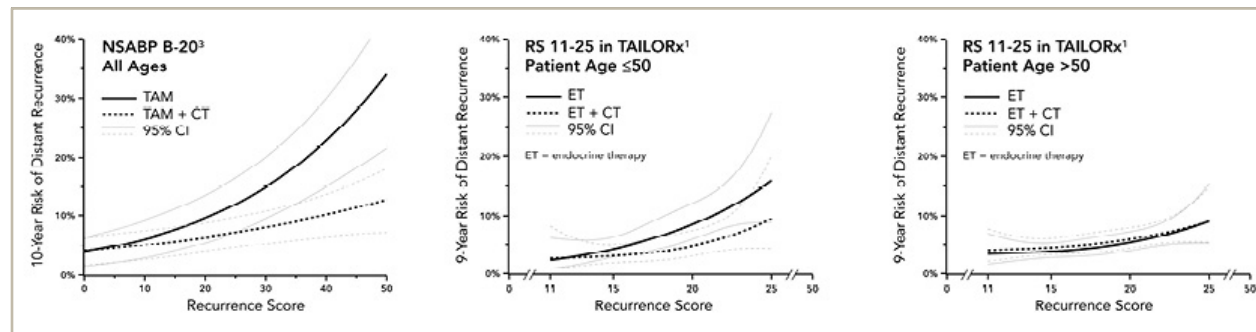

Age	RS 0-10	RS 11-15	RS 16-20	RS 21-25	RS 26-100
>50 years	No CT Benefit (<1%)				>15% CT Benefit
≤50 years	No CT Benefit (<1%)	~1.6% CT Benefit	~6.5% CT Benefit	>15% CT Benefit

## QUANTITATIVE HORMONE RECEPTOR ANALYSIS

Quantitative Single-Gene Scores for quality control. The Oncotype DX test uses quantitative RT-PCR to determine the RNA expression of ER, PR, and HER2, using the published validated cut-offs<sup>4</sup>. The standard deviations of single-gene results are less than 0.5 units. The RT-PCR single-gene results may differ from ER, PR, or HER2 results reported using other methods or reported by other laboratories.

ER Score

8.8

PR Score

7.9

HER2 Score

8.8
